French drainage or drainage tile is built by filling the trench with gravel, and a perforated pipe is used at the bottom to drain groundwater. Geotextile fabric wraps pipes and gravel, acting as a sieve where small sediments will not pass into the area where the gravel is located. Properly designed French drainage reduces the pressure exerted on retaining walls and barrier walls, which over time can cause moisture in basements and crawl spaces. The French drainage system is an indispensable component of any subgrade waterproofing project. The French drain will move water and moisture away from the property, reducing water rationing and flooding into the back, patio or front yard. This is a common alternative used in the following applications: Basement walls Parking garages Behind keeping walls Split level buildings Low lying patios Areas with a high water table drainage system should not be more than 12 inches wide, between 6 and 8 inches will be ideal because it is probably longer and the water will be collected and transported better with fewer obstacles. As good practice, you can also have at least two gravel areas around the pipe and the geotextile fabric used to be installed so the pipe is completely covered by it. The French drainage system should be installed deep enough so that the water will eventually run into the pipe, instead of moving side by side or into the structure. The recommended tilt of the perforated pipe for the French drainage system is a one-inch drop of ten feet of horizontal mileage. When a French drain is used to protect living space, the invert bottom should be placed at least 2 inches below the finish floor level. However, it is recommended to use a professional consultant who can determine the correct height of the drainage system. The pipes indicated for use on French drainage pipes are usually 6-inch diameter perforated PVC SDR-35. If the work or area that will work is small, you can try the four inch pipe, but remember that it all come off on the amount of water being processed. Some experts recommend using smooth wall pipes, while others tend to use corrugated pipes. The perforated pipe is made with two rows of round holes, usually installed facing the bottom of the trench as part of the French drainage system. As a contractor, you can add a fabric filter to help reduce pipe clogging. In addition, you can make sure that the correct slope and the size of the pipeline is adequate to handle the flow of water. French drainage gravel should be washed three-quarters of an inch minimum and as large as 1 1/2 crushed stone. The upper 12 inches above the pipe should be filled with native soil, Avoid the crushed stone over the perforated pipe, which can damage the pipe. It is important to place gravel around the pipe because they will filter any sediment that the geotextile is unable to remove. An important part of French French it's a geotextile that covers the pipe. All shredded stone should be protected and wrapped with a geotextile filter, a durable manufactured material that will protect the pipe. The introduction of drainage tissue around the unit can prevent soil being washed in place and clogged the sewer. These filter geotextile tissues will prevent soil fines from entering the drainage system, prolonging the life of the drain and increasing productivity. There are prefabricated drainage systems in two parts: geotextile fabric and molded plastic core. Geotextile tissues are attached to the nucleus, providing excellent drainage, preventing the rear from entering the main channel. These prefabricated drainage systems can reduce installation costs because they can be installed faster than traditional drainage tiles. From the beginning, Google's 20 percent of the time was the carrot company used to lure the best and brightest to Googleplex. PhDs and other smart pants agreed to hand over their brains to the search giant for four days a week, and in turn they were given a fifth to work on any project of their imagination. The premise is that smart and creative people need space and time to pursue wacky thoughts pinballing through their heads, and that, unlike the industrial workplace model, you couldn't tie a creative person to the table knocking out widgets and expect them to stay, much less produce greatness. If wages and benefits were the key to keeping factory workers happy and productive, 20 percent of the time was the golden handcuffs for creative recruitment. But now comes word that Google is considering launching an in-house incubator where some of the company's smartest pants will come to work on their own full-time inspiration. According to the New York Times, the idea is one of several companies considering to deal with a recent exodus that sees some employees leave either to join faster, nimble startups like Facebook, or start their own companies. Current and former Googlers told the Times that they both felt things didn't move fast enough at Google, and that the projects they were working on- even those that saw the light got buried in a company as big as Google. There's a lot of these interesting features that are very hidden, said one, and a lot of people worked really hard and they were kind of sad that they spent a year of their lives on something that gets 0.1% use. All this begs the question: Can a company get so great that innovative incentives like 20 percent of the time are just not enough to hold on to the kinds of innovative, entrepreneurial employees who are the key to helping companies stay on the cutting edge? Google now has 23,000 employees, apart from 5,000 just five years ago. It has 70 offices in 38 countries. And while continues to bet on coming up with new features and offers, he nevertheless has a basket of products that need constant maintenance Update. If you're young and energetic, chomping at a bit to build cool stuff, do you think a company of 23,000 people would be the place to do it? Even Google CEO Eric Schmidt acknowledged that things don't move as fast as they once did. It's absolutely harder to get things out the door,' he told the Times. This is probably our biggest strategic issue. The incubator is 20 percent of the time on steroids. Thinking seems to be that giving your own entrepreneurs all the space in the world to work on their passions will keep them loyal to Google's mother. But even that may not be enough. Having a wolf at the door, as you do in startups, creates a force that pushes you to take risks and creatively in a way that just doesn't arise when you know your paycheck will continue to flow no matter whether your project succeeds or fails. And these risks and bursts of creativity are what produce real innovation. Wolf-perspective failure-also produces a rush of adrenaline that innovative souls feed on. You just can't get that rush when the next salary is guaranteed. Even Facebook, to which Google has lost more than 100 employees, has reason to fear a wolf. Predictions that Facebook's IPO will bring figures as high as \$100 billion are all talk. There is no guarantee. And you can be sure that uncertainty about the actual outcome drives people on Facebook to move quickly and take a gamble that a larger, more established company will think twice about (or an endless series of meetings to discuss). This is of course coupled with the fact that Facebook is still a fairly small company. When it launched its Messaging feature this month, company executives touted the fact that the project was produced by the company's largest engineering team yet. What did that mean? Fifteen engineers. Fortified companies can only innovate so far, so Proctor and Gamble created the Connect and Develop program to get outside companies to innovate on their behalf (earning him a position on the Fast Company list). Similarly, Netflix created its \$1 million prize as a means of attracting outside talent to address the complex problem of improving its recommendation engine. Google will have to get used to seeing its best and brightest or at least its most entrepreneurial continue to go out the door, the incubator, not least. His best hope for innovative innovation may lie for the most part in the place from which it has emerged in recent years in acquisitions. What do you think? Has Google reached its natural limit of 20 percent time? Is there a moment when, no matter how creative their incentives, a large company simply can not keep in the staff of smart, creative engineers? Or is it actually possible for large companies to keep in the house, and keep them innovative? (Photo by Andrew Gura) Those of us who are busy all the time may experience burnout, exhaustion and fatigue from spending long periods of time time concentrated concentration. I call this Brain Drain Syndrome. I used to call it the head of the SAT because many students report that after taking SAT tests, they feel a strange mental bulge caused by too much focused thinking. Brain drain, if left unchecked, can lead to depression, stress, and even anger if you click after a leak is set in. Here are some of the signs that you may be suffering from a brain drain. Mental exhaustion. Irritation or drowsiness when you think about what you should do. Postponing certain tasks because they are too hard to think of. Snipping on others that don't move fast enough. Feeling as if the more you work, the farther behind you get. Feeling depressed, stressed, or as if you can't keep up mentally with your to-do list. Here are 10 ways you can defeat a brain drain. Meditate Meditate, I mean sitting and closing my eyes for 20 minutes or so. Sit still and just observe the thoughts that come to mind. Don't try to solve any problems. Just watch and let go. Walking a quick walk outdoors, especially in the park or anywhere you are not familiar with will take your mind away from your main task so it can relax. Notice the scenes as you travel. Stop and smell the roses, as the cliché says. It's a moment to see the beauty of the panoramas. Listening to classical music Sitting still with a relaxing Mozart or Bach play through headphones can overcome a brain drain. It will relax you, persuading your mind to think about other things. (Editor: Here are some free classical music downloads.) Read Something Entertainment There is nothing like a chapter of your favorite book to take your mind off the causes of your brain drain. Reading is an interactive action, so you keep your mind active while relaxing at the same time. Tip: Use reading for 10-20 minutes as a reward for 30 minutes of focused work. Use an egg timer to track. Reboot your brain with caffeine sleep. University studies show that drinking a cup of coffee and then immediately taking 10-15 minutes of catnap gives you a boost of energy. It's called caffeine sleep. I found that it works equally well for brain drain. (Just make sure you have something to do when you wake up because you'll be ready for rock 'n' roll.) Go to the movies. If you can fit into a two-hour movie in the theater, it costs time and money just so you can get away mentally and physically. Sitting in front of a big screen is a great way to take your mind off everything. Listen motivational That's the advice I took from Steve Peacock. When he is tired of intense thinking, he appears in a motivational CD. While it may seem like it will be more of a job, it is not. Listening, you can relax and become almost passive, as ideas and strategies gradually break down the sewers. Play sports show research shows people who make competitive sports such as tennis, basketball, golf, martial arts, or football are happier overall. Competing in sports can make you physically tired, but will wake you up mentally. When you wake up mentally, brain drain ceases to be a big problem. Break your project into bite-sized pieces. Rome wasn't built in one day. Maybe you're trying to move your mountain in a day too. Take half an hour or an hour to take a closer look at your projects. Are you trying to write a novel in one day, when it would be more practical to shoot three pages of a novel a day? You may be in a brain drain because you just don't have reasonable goals. Play the game Halo 3 players rejoice! Playing a game that gets you off your plum thoughts is a great way to go through lethargy. You may prefer crossword puzzles or Sudoku if you don't like video games. In any case, the game lets you know life doesn't always have to be so serious and focused. Hire time to play too! G/O Media can get a commission Mario Kart Live: Home Circuit Remember, the good news is brain drain means you use your brain at maximum power. The bad news is that you don't give your brain the necessary rest periods. Rest is important for creative thinking and problem solving. So you need a series of short breaks between jobs at a high level. So, when planning your next intensive project, be sure to dissipate in a few planned periods where you can take a break and give your brain some time to incubate.
